

SANHUA

Stainless Steel Brazed Plate Heat Exchanger

A magnificent turn into new chapter

SANHUA's patented asymmetric plate design has in average 25% lower pressure drop on secondary side compared to other solutions available on the market.

Introduction

With the global push for carbon neutrality, industries are prioritizing renewable energy adoption and energy-saving technologies to reduce emissions. In the HVAC&R sector, applications such as heat pumps, electric bus air conditioning, and energy storage battery cooling are key areas where renewable energy is utilized— and within these systems, brazed plate heat exchangers (BPHEs) play a crucial role.

Improving system efficiency is one of the most effective ways to conserve energy. Compared to other heat exchangers designed for similar purposes, a well-designed BPHE offers superior heat transfer efficiency and lower pressure drop on the secondary side. BPHE's are also widely used in heat recovery circuits, delivering hot water or heating while cooling, thereby enhancing overall system performance.

BPHE's contribute to energy savings from multiple angles. In 2021, Sanhua officially

entered the stainless steel BPHE market, reinforcing our commitment to providing eco-friendly solutions. Before this expansion, Sanhua had already established itself as a leader in aluminium BPHEs for the automotive and residential appliance industries. Leveraging years of expertise, we introduced a series of optimized designs to our stainless steel BPHE portfolio.

Thanks to Sanhua's advanced laboratory facilities, the benefits of these innovations are backed by extensive testing and real-world performance data, providing valuable insights for our customers. Many of our lab tests are conducted under comprehensive conditions, ensuring that our products deliver tangible value in diverse applications.

We are pleased to introduce some of our latest technologies and the product portfolio they enhance.

Sanhua BPHE Thermal Performance

Test Chamber
(Maximum capacity: 350 kW)

innovating
TOGETHER

Visible performance and reliability

PLATE WITH REDUCED DEPTH

By reducing the depth of the plate, the heat transfer efficiency is improved but the pressure drop is still within acceptable range. BPHE with reduced plate depth is especially suitable for economizer functions.

TEMPERATURE FATIGUE RESISTANCE

Temperature fatigue happens mostly in heat pump or cascade systems where high and low temperatures exchanges frequently, as a result the brazing between the plates will fail. The mixing of media of both sides will damage the entire system and even lead to more serious consequences.

ANTI-FREEZING DESIGN

In the scenario of refrigerant/water exchange, it is necessary to prevent water temperature from falling to the freezing point and the plates from cracking. The mixing of refrigerant and water will damage the entire system and even lead to more serious consequences. Especially in chillers and heat pumps, during the start-up low pressure and low temperature may happen and resulting in icing on the water side. When the heat pump is switched from heating to defrosting, there is also a high risk of water freezing. Although proper system control can minimize the risk, there are still a lot of work can be done with BPHE itself. The BPHE is designed in the way that the water bypasses the risky areas and the areas with very low velocity, as a result the risk of freezing is much lower. Such extreme conditions are always challenges to achieve in customer's system test but Sanhua's freezing test bench can verify the freezing temperature at various conditions, so that customers can use them with confidence.

HIGHLY EFFICIENT DISTRIBUTOR

The design of distributor is especially critical for medium and large size evaporators. Sanhua distributor has its own design patent, and the distribution holes are part of the plates and making the heat exchanger extremely compact. Through the thermal imager in our laboratory, we can find how equally the distributor is distributing the refrigerant into all channels, maximizing the use of heat exchange area.

ASYMMETRIC PLATE

With traditional symmetrical design, the channel area of primary and secondary sides are almost identical, it is simple and easy to produce. In reality different channel are required for primary and secondary side. By introducing asymmetric plate design, we properly reduced the volume of primary side to increase the evaporating temperature and heat transfer efficiency but still control the pressure drop within acceptable range. We take care of pressure drop more on secondary side, by increasing the volume of secondary side, the pressure drop is reduced dramatically and as a result the power consumption of the pump will be reduced drastically as well. Sanhua's thermal performance test chamber is able to test the temperature approach (dT) and pressure drop with various refrigerant and conditions. The data is showing in average 1K lower in dT and 25% lower in pressure drop even compared to asymmetric design from others.

Brazed plate heat exchanger

Sanhua is always thinking and working globally, and we have obtained EU PED certification from authorized 3rd party. Our BPHEs legally work with fluid group 1 and group 2, including water, ethylene glycol solution, common HCFC, HFC, HC and HFO refrigerants such as R410A, R32, R454B, R290, R134a, R404A, R507, R448A, R449A, R1234yf, R1234ze and R452A etc. The design pressure is up to 50 bar.

S6B

INTRODUCTION

SANHUA S6B is widely used as economizer on VRF or as evaporator and condenser on small capacity heat pump. S6B has the compact structure and enhanced heat transfer advantages. The heat transfer capacity range is 1~5 kW. Its mechanical design and reliability performance makes it suitable for high-pressure refrigerant such as R410A and R32.

S6C

New!

INTRODUCTION

SANHUA S6C series features the advantages of compact structure and enhanced heat transfer. It is widely used in the economizers of VRF and air heaters, as well as the evaporators and condensers of small - capacity heat pumps. The heat transfer capacity ranges from 1 to 5 kW. It is suitable for high-pressure refrigerants such as R410A and R32. The S6C is optimized based on the S6B. It adopts a stamped connection design. The connection can support bimetallic composite materials of copper and stainless steel, making the welding process more convenient.

S11A

INTRODUCTION

SANHUA S11A is widely used as economizer for VRF and heat pump. It can also be used for E-bus battery cooling or as evaporator for chiller with capacity below 5 kW.

With the optimized shallow fishbone design, the heat transfer is enhanced and the pressure drop of water side (or secondary side) is decreased. The lower hold-up volume reduces the system refrigerant charge.

S11A is offering 2 options of design pressure, they are 3 MPa and 5 MPa for low and high-pressure refrigerant respectively.

B12

New!

INTRODUCTION

SANHUA B12 series is mainly used in boilers. This product is specially developed for boilers. The maximum heat transfer capacity can reach 80 kW. It adopts a double fishbone design, resulting in low flow resistance. It can be installed in various ways, featuring a compact structure, high heat transfer efficiency, and strong reliability.

S20D

New!

INTRODUCTION

SANHUA S20D can be used as evaporators, condensers, economizers, and desuperheaters in chiller units and heat pump systems. It can also be applied to commercial refrigeration and cold - storage systems. For example, it can serve as the economizer and intercooler of commercial refrigeration units or transport refrigeration units, or as the water - cooled condenser of semi - self - contained display cabinets (Waterloop system). The S20D features a compact structure. It adopts an optimized fishbone design, ensuring high heat - transfer efficiency. The S20D is suitable for R290 systems. Laser welding is used between the connection and the heat - exchanger body, and it can be adapted to various types of connections.

S27C

INTRODUCTION

SANHUA S27C can be used as an evaporator, condenser, economizer and desuperheater in chillers, heat pumps and also suitable for 6~9 kW energy storage system. S27C is compact, has high heat transfer efficiency and high reliability.

ACCESSORIES-STUD BOLTS

Stud bolts and feet on front /end cover plate for mounting support are available upon request.

S30A

INTRODUCTION

SANHUA S30A is widely used as condenser or evaporator in air-cooled chillers (or heat pumps) with capacity up to 30 kW. Its high reliable structural design makes it suitable for high-pressure refrigerants such as R410A and R32. The plate adopts optimized asymmetric fishbone design and innovative distributor design, which has high heat transfer efficiency and reduces water side pressure drop. The lower hold-up volume will help to reduce the refrigerant charge.

S40A

INTRODUCTION

SANHUA S40A is widely used as condenser or evaporator in air-cooled chillers (or heat pumps) with capacity up to 50 kW. Its high reliable structural design makes it suitable for high-pressure refrigerants such as R410A and R32. The plate adopts optimized asymmetric fishbone design and innovative distributor design, which has high heat transfer efficiency and reduces water side pressure drop. The lower hold-up volume will help to reduce the refrigerant charge.

S60

INTRODUCTION

SANHUA S60 is widely used in chillers, heat pumps and IT cooling as evaporator or condenser. It is also used as economizer or oil cooler for screw chillers. The optimized plate technology can reduce the water side pressure drop and provide efficient heat transfer performance at the same design temperature.

S65A

New!

INTRODUCTION

SANHUA S65A is suitable for new refrigerant R290, which can be widely used in chillers and heat pump systems as evaporators and condensers, with a heat transfer capacity of 10~90 kW. S65A adopts a double asymmetric plate structure and a shallow corrugated plate structure, which can effectively improve the asymmetric ratio of the water side and the refrigerant side channels, making the product structure more compact. Compared with S60B, the charging capacity of R290 is reduced by about 37% (Heat exchanger inside).

S114A

INTRODUCTION

SANHUA S114A can be used as an economizer for modular units and screw compressors, and it can also be applied in data center cooling systems. Its heat transfer capacity ranges from 30 to 200 kW. The S114A adopts a double-asymmetric plate structure and an optimized distributor design, which reduces the water - side pressure drop while providing high - efficiency heat transfer performance.

S120

New!

INTRODUCTION

SANHUA S120 is mainly used for water-to-water or water-to-ethylene glycol heat exchange in data centers. The heat transfer capacity ranges from 30 to 400 kW. It adopts a fishbone design, featuring low flow resistance, a compact structure, high heat transfer efficiency, and strong reliability.
